

Wash Water Recovery and Filtration Mobile Units

Protecting the environment from wash water runoff and complying with governmental storm drain regulations is simple, economical and effective with one of our portable recovery/filtration trailers. Our vacuum recovery and filtration systems provide up to 12gpm continuous processing of wastewater where soaps and other chemicals are not used.

Wastewater is recovered through various containment methods and devices to eliminate run-off. Recycled water is pumped back to your bulk water tank for reuse in various pressure washing applications or diverted to sewer as permitted. Heavy solids and containenants are collected and filtered out to provide 5 micron level recycled water. The systems are easily maintained and cost effective to operate.

When combined with one of our commerical pressure washer packages, you have a complete self-contained mobile wash, recovery, and recycle unit. These systems are the choice of professional cleaners to protect the environment, conserve water, and comply with EPA storm drain requirements. (For use with cold water or hot water up to 200°F).

Contact us today and we can custom design a system to meet needs!
